

PLATFORM OVERVIEW

A Complete Government-Exam Preparation Ecosystem

A bilingual (Hindi & English) learning platform that takes a student from "what do I study today?" through structured courses, testing, revision and doubt-resolution — plus everything an institution or academic team needs to run and monetise that learning experience.

Prepared for: Customer showcase & evaluation

Covers: Student learning · Content operations · Institutions & billing · Payments · Admin & security

1 What RajyaRank Is

RajyaRank is built as a complete exam-preparation ecosystem, not a video-selling site. Every screen is designed around one question the student actually has: **"what should I study today?"** — rather than handing them a video library and leaving them to figure out a plan. The platform is fully bilingual (Hindi-first, with English throughout) and built to scale from a single Indian state to many, and from a single training institute to a multi-institution marketplace.

Students

Teachers

Question Setters

Academic Reviewers

Content Admins

Institution Heads

Support Agents

Super Admin

Two purpose-built applications

A public marketing site + student learning app, and a completely separate staff/admin portal — each with its own login, its own permissions, and an experience tailored to what that person actually needs to do.

Built to expand

State → Exam → Course → Batch → Subject → Chapter → Topic → Lesson is a first-class data model, not a hardcoded shortcut — new states, exam bodies and institutions plug in without a rebuild.

FOR LEARNERS

2 The Student Experience

Everything a student needs to go from "just enrolled" to "exam-ready," in one guided flow.

Daily-plan dashboard

Auto-generated today's-plan, continue-learning shortcut, streak tracker, weekly goal ring and exam countdown — answers "what now?" every time a student opens the app.

Adaptive study plan engine

Bin-packs remaining lessons into each day's time budget, interleaves drills on the student's single weakest topic, auto-regenerates after a missed streak, and lets students reschedule any item.

Structured curriculum & player

Subject → Chapter → Topic → Lesson browsing, a video/PDF player with resume-from-last-position, bookmarking and a "mark complete" flow, and a distraction-free lesson view.

Full bilingual test engine

Timed mock tests with an answer palette, mark-for-review, autosave and auto-submit; server-side scoring only (answers never sent early); results include subject-wise analysis, rank and percentile.

Revision & weak-topic focus

A dedicated revision centre surfaces bookmarked and in-progress material, plus a "focus areas" panel computed directly from real test performance — not a guess.

Current affairs, doubts & notifications

A running current-affairs feed, an in-app doubt system (ask against a lesson/question/test, get a threaded reply), and notification preferences across in-app/email/SMS.

Access & protection: content access is governed by real entitlements (free, paid, trial, scholarship, coupon, admin-granted, institution-sponsored) — never a single "is this user paid" flag — and every paid video/PDF is served through short-lived signed URLs with an optional watermark, so protected content can never be shared as a permanent public link.

Sign-up, your way: students can join by phone + OTP, email + password, or (for institution-enrolled students) an account their Academic Head sets up directly — no SMS cost for internal cohorts that don't need it.

FOR ACADEMIC TEAMS

3 Content & Academic Operations

A real editorial pipeline — not a folder of uploads — so nothing reaches a student without being reviewed and approved by someone other than the person who wrote it.

Course Studio

A guided, step-by-step course builder — template, basics, audience, learning design, curriculum, content, pricing, review — that autosaves as staff progress, so nothing is lost mid-flow.

Curriculum builder

A collapsible Subject → Chapter → Topic → Lesson tree with drag-free reordering, cascade-aware delete confirmations, and a single "+ Add lesson" launch point per topic.

Maker/checker content workflow

Draft → Submitted → Under Review → Correction Required / Approved → Ready to Publish → Scheduled / Published — full version history, and the person who writes content is never the one who publishes it.

Review queue with a quality checklist

Reviewers work a scope-filtered queue (only what's assigned to them) with a structured checklist before approval is even possible, plus inline comments and correction requests.

Question bank & bulk import

All standard question types, bilingual by design, with row-level-validated CSV/Excel import for building a large bank quickly instead of one question at a time.

Mock test builder

Assemble tests from approved questions only, set sections/timing/passing score, and publish through the same review-gated pipeline as every other content type.

Media, reused not re-uploaded: staff can attach an already-uploaded, approved video or PDF to a new lesson instead of uploading the same file twice — and every lesson can be explicitly saved as a draft or submitted for review, staff's choice.

4 Multi-Institution Platform

RajyaRank isn't only a direct-to-student product — it's a platform other coaching institutes can run their own branded operation on top of, with full data isolation between institutions.

- ✓ **Full tenant isolation.** Each institution's staff, students, courses and content are scoped to that institution alone — an Institution Head sees only their own organisation, never another's.
- ✓ **Institution Head dashboard.** A dedicated admin experience for enrolling students, inviting staff, managing courses/content, and tracking institution-wide progress — without platform-level access.
- ✓ **Institution self-service billing.** Institutions subscribe to a platform licence plan (monthly/annual), billed automatically with generated invoices — a real recurring-revenue line for RajyaRank, run without manual invoicing.
- ✓ **Marketplace-style revenue split.** Institutions can sell their own courses through the platform with KYC-verified linked payout accounts and an automated settlement engine that splits gateway fees, platform commission and payouts — the same model as a modern multi-vendor marketplace.
- ✓ **Student self-service join.** Students can join an institution with a simple access code, or be enrolled directly by their Academic Head — both paths keep institution-scoped pricing and content visible correctly.

MONETISATION

5 Payments, Pricing & Entitlements

Razorpay, done the safe way

Orders are created and verified entirely server-side — signatures and webhooks are cryptographically verified, never trusted from the browser — with idempotent handling so a retried webhook can never double-grant access.

Flexible access types

Free, one-time paid, trial, scholarship, coupon-discounted, admin-granted, institution-sponsored and subscription access all coexist — priced per audience (public vs. institution-only pricing).

Coupons & refunds

Discount codes at checkout, and a full refund workflow with auto-approval below a configurable threshold and Super-Admin escalation above it — a real separation-of-duties control, not a rubber stamp.

A single ledger, not guesswork

Every order — direct student purchase, institution-sponsored, or admin-granted — lands in one searchable payments ledger for admins, filterable by institution.

FOR OPERATORS

6 Admin & Platform Management

Role	What they can do
Super Admin	Platform-wide oversight: institutions, billing plans, roles & permissions, payments, refunds, marketing content, announcements, audit trail.

Role	What they can do
Institution Head	Runs one institution end-to-end: staff, students, courses, content, payments — scoped to their own organisation only.
Content Admin	Creates and edits courses/content/questions at scale — the "maker" side of the workflow.
Academic Reviewer / Head	Reviews, approves and publishes content and mock tests — the "checker" side.
Support Agent	Handles student support tickets and doubt escalations.

Assignment-scoped permissions

Access depends on role *and* what a staff member is actually assigned to (state / exam / course / subject / batch) — never role-name alone, and every check happens server-side.

Analytics, per role

A dashboard tailored to each role — institution overview, content pipeline health, review-queue status or platform-wide numbers — instead of one generic screen everyone has to interpret differently.

Announcements & marketing CMS

Super Admin can broadcast to students/staff/everyone, and manage the public marketing site's content — without an engineering ticket for every copy change.

Full audit trail

Every sensitive action is written to an append-only audit log — who did what, when, and whether it was allowed — reviewable by Super Admin.

BUILT TO BE TRUSTED

7 Security, By Default

None of this is bolted on afterward — it's the same standard every feature above is built to.

- ✓ **Strong authentication.** Hashed passwords (argon2id), refresh-token rotation with reuse detection, and step-up multi-factor authentication for high-risk staff actions.
- ✓ **Server-side authorization, always.** Every protected action is re-checked on the backend against role, scope and content status — hiding a button in the UI is never the security boundary.
- ✓ **Protected content delivery.** Paid video/PDF is only ever served through short-lived signed URLs, with optional watermarking and concurrent-session limits.
- ✓ **Verified payments.** Cryptographically verified order signatures and webhooks, idempotent by design — a payment can never be accepted unverified or double-counted.
- ✓ **Everything logged.** An append-only audit trail, rate limiting and lockout on authentication attempts, and structured request logging for every API call.

See it live

This overview covers platform capability, not a live demo. The best next step is a guided walkthrough of the student app and the admin portal together, using real course content.
